Legal Description and Evidence of Site Ownership

The legal description of the WWTP site is found on page 2 of the discharge permit application enclosed in Appendix 8.F. The metes and bounds description is NW ¼ of NE ¼ of SW ¼ and SW ¼ of SE ¼ of NW ¼ and all of NW ¼ of SE ¼ of NW ¼ LY S of Farmers Ditch 19-5-68.

Section 8 – Technical Support Appendices

Appendix 8.B

Special Surveys (e.g., Endangered Species)

Special surveys are not required for the WWUP and are not included. Special surveys are typically part of the NEPA process for SRF funding as discussed in Section 3 or for new site locations for infrastructure additions. The City currently has no plans for pursuing SRF funding for any projects. Should the City's funding needs change, they will comply with all funding requirements for special surveys. The existing WWTP site will continue to be used throughout the planning period. Any new interceptors or lift station locations are planned for the planning period may require special surveys if federal funding (e.g. SRF) is involved. Other special surveys that could be applicable to a new project site include endangered species and historic preservation.

Section 8 – Technical Support Appendices

Appendix 8.C

NEPA Process

As noted in Section 3, the City is not applying for an SRF loan or any other federal funding in association with this Utility Plan. There are no improvements immediately proposed that involve federal land management or would constitute a major federal action which would trigger NEPA requirements at this time.

SCOPE

This report presents the results of our geotechnical investigation for the proposed improvements to the wastewater treatment plant located at 920 South Boise Avenue in Loveland, Colorado (Figure 1). The purpose of the investigation was to evaluate the subsurface conditions and provide foundation recommendations and geotechnical design criteria for the project.

The report was prepared from information provided by CH2M Hill and data developed during field exploration, laboratory testing, engineering analysis, and experience with similar conditions. The report includes a description of subsurface conditions found in our exploratory borings and discussions of site development as influenced by geotechnical considerations. Our opinions and recommendations regarding design criteria and construction details for foundations, slabs-on-grade, lateral earth loads, and drainage are provided. If the project grading, building locations/elevations, or proposed construction change, we should be notified. Our opinions are summarized in the following paragraphs. More complete descriptions of the subsurface conditions, results of our field and laboratory investigations and our opinions, conclusions and recommendations are included in the subsequent sections of this report.

SUMMARY OF CONCLUSIONS

1. Soils encountered in our borings consisted of between 3 and 12 feet of fill materials over clayey sands and gravelly sands. In the boring at the planned odor mitigation system, the soils are underlain by claystone bedrock at a depth of 10 feet (elevation 4915, Figure 2). Ground water at this location was measured at a depth of about 13½ feet (elevation 4913). In the vicinity of the grit chamber and associated structures, claystone bedrock was encountered at a depth of 32 feet below ground surface (elevation 4891). Ground water was measured at this location at depths of about 24 to 26 feet (elevation 4896 to 4898). Existing groundwater levels are not expected to significantly affect site development.

2. Existing fill was encountered in all four borings. Deeper fill was encountered in the vicinity of TH-2, TH-3, and TH-4. Existing fill should not support foundations. We recommend removal and recompaction of the existing fill beneath the planned headworks structures.
3. We believe footing foundations or reinforced concrete mat foundations can be used to support the proposed structures. The structures should be arranged to accommodate minor settlements and relative movements. Foundation discussion and criteria for foundations are provided in this report.

SITE CONDITIONS

The wastewater treatment plant is located on the east side of South Boise Avenue and north of Highway 402, at Tuxhorn Boulevard in Loveland, Colorado (Figure 1). The site consists of an existing wastewater treatment facility with numerous structures and treatment systems. The plant improvements are generally located between, and will connect, to many of these structures.

Typically, the site slopes to the south over most of the plant site. The area north of Tuxhorn Boulevard has a slope of approximately 5 percent and is grass covered. The portion of the site with the majority of the planned upgrades was nearly level with partial grass cover and partial paving, existing buildings and numerous treatment structures.

PROPOSED CONSTRUCTION

Based on conversations with the client and the information provided for our use, we understand the expansion of the wastewater treatment facility headworks will consist of construction of a vortex grit separator with a diameter of 18 feet, a grit pump station, an influent pump station, and a biofilter. Connecting pipelines, channels along with water control and sampling structures will be constructed.

We understand the biofilter will be used for odor mitigation and will consist of a shallow bin type structure containing organic treatment material or similar material. A manifold beneath the organic material will disperse air from the plant for treatment. The biofilter will be located in the vicinity of boring TH-1 (Figure 1), north of the existing administrative building.

The other structures will be located to the west of the administrative building and south of the headworks (TH-2, TH-3, and TH-4). The existing nearby structures are on a variety of foundations including footings and drilled piers. The influent pump station, grit basin and grit pump station will be arranged such that the top of the structures will be near existing ground surface. The bearing elevation of these structures will be between elevation 4904 and 4907 feet (approximately 17 to 19 feet below existing grades).

INVESTIGATION

Subsurface conditions at the site were investigated by drilling four borings in the areas of the proposed structures. The approximate locations of the borings are shown on Figure 1. Our field representative observed drilling, logged the soils found in the borings and obtained samples. Summary logs of the borings, including results of field penetration resistance tests, are presented on Figure 2.

Samples obtained during drilling were returned to our laboratory and visually examined by the geotechnical engineer for this project. Laboratory testing included natural moisture content and dry density, swell-consolidation, Atterberg limits, gradation, pH and water-soluble sulfate tests. Results of laboratory tests are presented in Figures 3 through 6 and summarized on Table I.

SUBSURFACE CONDITIONS

Soils encountered in our boring at the planned odor mitigation system consisted of 3 feet of fill over clayey sands and gravelly sands. The soils in this area are underlain by claystone bedrock at a depth of 10 feet (elevation 4915, Figure 2).

Soils encountered in the vicinity of the grit chamber and associated structures (TH-2, TH-3 and TH-4) consisted of 3 feet of fill over clayey sands and gravelly sands. Claystone bedrock in this area was encountered in one boring at a depth of 32 feet below ground surface (elevation 4891).

Ground Water

At the biofilter location (TH-1), ground water was measured at a depth of about 13½ feet (elevation 4913). Ground water at the grit chamber location (TH-2, TH-3 and TH-4), was measured at this location at depths of about 24 to 26 feet (elevation 4896 to 4898). Groundwater levels will vary seasonally and may rise as development of the site progresses. The existing groundwater levels are not expected to significantly affect site development. We suggest assuming a groundwater elevation rise of 5 feet above that measured in our borings during wetter seasons and wetter years.

Seismicity

This area is subject to a low degree of seismic risk. Based upon the 2003 International Building Code (2003 IBC) and the results of field penetration tests, the site classifies as Seismicity Site Class C. The soils and groundwater conditions indicate low susceptibility to liquefaction.

CONSTRUCTION

Existing Fill and Structures

Existing fill was encountered in the borings to depths ranging from 3 to 12 feet. Deeper fill areas may be encountered during proposed improvements. The fill is of unknown origin and age, but is assumed to be primarily backfill from the construction of adjacent structures and installation of utilities. There is a significant potential of settlement or heave for improvements supported by the fill. We recommend the fill be removed and recompacted if located beneath any of the planned structures.

The fill removal area should extend beyond the planned structure footprint at least 5 feet. If the excavations are deeper than about 10 feet in the planned improvement area, additional measures should be considered to reduce the potential settlement of backfill. We should be advised if any of the excavations are deeper than 10 feet below the proposed floor. The excavation can be filled with on-site soils, moisture-conditioned and compacted to the specifications in Fill Placement, below. Removal of the existing fill will provide more uniform support for improvements.

The existing fill can also affect pavements and exterior flatwork. The lowest risk alternative for exterior pavement and flatwork would also be complete removal and recompaction. The cost could be significant. If the owner can accept a risk of some movement and distress in these areas then partial depth removal is an alternative. We suggest removal of the existing fill to a depth of 1 to 2 feet below existing grade, proof rolling the exposed subgrade, and additional removal or stabilization of areas where soft, yielding or organic soils or debris is encountered. After this, fill placement can proceed to construction grades.

Excavation

Excavations of up to 20 feet are anticipated for the proposed improvements. Bedrock was not encountered within the planned excavation depths. We believe the soils encountered during this investigation can be excavated with typical heavy duty excavation equipment.

Excavation sides will need to be sloped or braced. We recommend the owner and contractor become familiar with applicable local, State and Federal safety regulations, including the current OSHA Excavation and Trench Safety Standards. The contractor should be aware that in no case should slope height, inclinations, excavations or depths including utility trench excavations exceed those specified in local, State and Federal safety regulations. Specifically, the current "OSHA Health and Safety Standards for Excavations" should be followed.

For this site, the overburden soil encountered in our exploratory borings includes sandy clay and clayey sand fill, clayey sand, and gravelly sand. We believe the overburden soil may classify as Type C soils, allowing excavation slopes of 1.5h:1v. If groundwater is encountered and seeps from the slopes, this may require other precautions.

Our preliminary soil and bedrock classification is based on the materials encountered in our exploratory borings. The soil penetrated by the proposed excavation may vary across the site. The contractor's "responsible person" should evaluate the soil exposed in excavations as part of the contractor's safety procedures. If an excavation (including a utility trench) is extended to a depth of more than 20 feet, it will be necessary to have the side slopes designed by a registered engineer. Vehicles and soil stockpiles should be kept a minimum lateral distance from the crest of the trench slope equal to one-half the trench depth. The exposed slope face should also be protected against the elements. As an alternative to temporary slopes, vertical excavations can be temporarily braced.

Temporary Bracing

Bracing or “trench box” construction may be necessary in order to limit the width of excavations and reduce the amount of surface disturbance. Bracing systems include driven sheet piling, soldier piles and lagging and others. Lateral loading of bracing depends on the depth of excavation, slope of excavation above the bracing, soil stockpiles and other surface loads, hydrostatic pressures, and allowable movement.

For bracing allowed to move enough to mobilize the strength of the soils with associated settlement and cracking of the ground surface, “active” earth pressure conditions are appropriate for design. If movement is not tolerable, “at rest” earth pressures are appropriate. Lateral load can be calculated using an equivalent fluid density of 45 pcf and 55 pcf for “active” and “at rest” conditions, respectively. We suggest assuming a “passive” equivalent fluid density of 250 pcf to calculate soil resistance. Graphical presentations of typical lateral loading configurations are presented in Figure 7 of this report. These pressures do not include allowances for surcharge loading or for hydrostatic conditions. Hydrostatic pressure and surcharge loads should be accounted for, where applicable.

The OSHA construction standard provides recommendations for timber bracing. We are also available to assist further with bracing design if desired.

Dewatering

Groundwater was encountered in three of the four borings at depths of 13 to 26 feet. The shallow groundwater (less than 25 feet in depth) was observed in TH-1, at the location of the proposed biofilter. Our experience in this area suggests that groundwater depths can vary with season and, depending on the time of construction, could be higher than measured in our borings. However, based on our observations we believe ground water will likely not be present in the excavations for the treatment system.

If ground water is observed during excavating, the contractor should consider temporary dewatering prior to and/or during construction. Dewatering can be accomplished using a series of trenches and sumps and granular materials from which water can be pumped, or by a system of well points. The sumps should be several feet below the bottom of the excavations to pump water down through the soil rather than up through the bottom of the excavation. The ground surface surrounding the excavation should be sloped to direct runoff away from the excavation. The design of a well point system will likely require further exploratory drilling to deeper depth and permeability tests both of which were not in the scope of this study.

Fill Placement

The existing on-site soils are suitable for re-use as fill material provided debris or deleterious organic materials are removed. If import material is required, we recommend importing granular soils for use below floor areas. Import fill should contain 10 to 40 percent silt and clay sized particles (percent passing No. 200 sieve) and exhibit a liquid limit less than 30 percent and a plasticity index less than 15 percent. Other materials may be acceptable for use as fill on this project pending our review and approval.

Areas to receive fill should be scarified, moisture-conditioned and compacted to at least 95 percent of standard Proctor maximum dry density (ASTM D 698). The properties of the fill will affect the performance of structures, slabs-on-grade, and pavements. Sand soils used as fill should be moistened to within 2 percent of optimum moisture content. Clay fill soils placed below the building should be moisture conditioned to 1 to 4 percent above optimum moisture content. Clay fill placed exterior to the building can be moistened to between optimum and 3 percent above optimum moisture content. The fill should be moisture-conditioned, placed in thin, loose lifts (8 inches or less) and compacted as above. Placement and compaction of fill should be observed and tested by a representative of our firm during construction. Fill placement and compaction activities should not be conducted when the fill material or subgrade is frozen.

Fill in areas of landscaping where no future improvements are planned can be placed at a density of at least 90 percent of standard Proctor maximum dry density (ASTM D 698). Example site grading specifications are presented in Appendix C.

FOUNDATIONS

We considered several types of foundations to support the structures, including footings, mat foundations, straight-shaft drilled piers penetrating the claystone bedrock and end-bearing piling driven to practical refusal in the claystone. The deep foundation systems of piers or piles would transmit foundation loads to more stable materials at a deeper elevation, reducing the potential for movement. However, we understand that a shallow foundation system is preferred for these additions and the potential for movement can be accounted for in the design of the different components. For this reason we have not discussed deep foundations further in this report. We can provide geotechnical design criteria for these systems, if requested.

We believe footing or mat foundations can be used to support the planned structures. The soils encountered at the foundation elevation include medium dense clayey sands. Footing and mat foundations have a higher risk of movement than deep foundation systems. We estimate potential foundation movements of less than one inch could occur for foundations designed and constructed to the criteria below.

We understand that some of the planned structures lend themselves to either footing or mat foundations due to their configuration. Therefore we have included recommendations for both types of systems. Design and construction criteria for footing foundations are provided below. Criteria for mat foundation follow. These criteria were developed from analysis of field and laboratory data and our experience. The recommended foundation alternative can be used provided all design and construction criteria presented in this report are followed.

Footings

1. **Footings should be supported on undisturbed natural soils or densely compacted, engineered fill (see CONSTRUCTION). All existing man-placed fill should be removed from under footings and within one footing width around footings and replaced with engineered fill. Where soil is loosened during excavation, it should be removed and replaced with on-site soils compacted following the criteria in the Fill Placement section of this report.**
2. **Footings bearing on the natural soils and/or engineered fill can be designed for a maximum net allowable soil pressure of 2,000 psf. The soil pressure can be increased 33 percent for transient loads such as wind or seismic loads.**
3. **Footings should have a minimum width of at least 16 inches. Foundations for isolated columns should have minimum dimensions of 24 inches by 24 inches. Larger sizes may be required depending on load and the structural system used.**
4. **The soils beneath footing pads can be assigned a coefficient of friction of 0.35 to resist lateral loads. The ability of grade beams, or footing backfill to resist lateral loads can be calculated for using a passive equivalent fluid pressure of 250 pcf. This assumes the backfill is densely compacted and will not be removed. Backfill should be placed and compacted to the criteria in the Fill Placement section of the report. These values are considered ultimate values and appropriate factors of safety should be used. Typically, a factor of safety of 1.5 is used for sliding and 1.6 for lateral earth pressure.**
5. **Exterior footings should be protected from frost action. Normally, 30 inches of frost cover is assumed for this area.**
6. **Below grade walls and grade beams should be well reinforced both top and bottom. We recommend the amount of steel equivalent to that required for a simply supported span of 15 feet.**
7. **Completed footing excavations should be observed by a representative of our firm to confirm that the soils are as we anticipated from our borings. Occasional loose soils may be found in foundation excavations. If this occurs, we recommend the loose soils be treated as discussed in Item 1 above.**

Mat Foundations

- 1. The mat foundation should be constructed on undisturbed native soils. Where soils are loosened during excavation or in the forming process for the foundation, the loose disturbed material should be removed and replaced with Colorado Department of Transportation (CDOT) Class 6 Road Base (or other approved equivalent) compacted to at least 100 percent of standard Proctor maximum dry density (ASTM D 698) within 2 percent of optimum moisture content. Unevenness in the excavation bottom can be leveled with a course of low strength concrete or flow fill.**
- 2. The mat foundation should be designed for a maximum net allowable soil pressure of 1,000 psf.**
- 3. Reinforced slabs are typically designed using a modulus of subgrade reaction. We recommend use of a modulus of 60 pounds per square inch per inch of deflection (pci).**
- 4. Lateral load applied to mat foundations can be resisted by friction between the concrete at the base of the mat and the ground and by the passive pressure of densely compacted backfill and/or undisturbed ground against the side of a mat provided that soil will not be removed over the life of the structure. A friction coefficient of 0.35 can be used between the foundation concrete and the natural soil, backfill or bedrock. The passive earth pressure against a mat can be calculated using an equivalent fluid density of 250 pcf for undisturbed soil or engineered fill. Graphical presentations of typical lateral loading configurations are presented in Figure 7 of this report. A moist unit weight of 125 pcf can be assumed for natural soils and compacted granular backfill. These values are considered ultimate values and appropriate factors of safety should be used. Typically, a factor of safety of 1.5 is used for sliding and 1.6 for lateral earth pressure.**
- 5. The edges of the mats should be thickened or turned down for structural strength.**
- 6. Materials beneath the mat foundation should be protected from frost action. Normally, 30 inches of frost cover is assumed in this area.**
- 7. The completed foundation excavation should be observed by our representative to verify the subsurface foundation conditions are as anticipated from our borings and are suitable for supporting the mat foundation. Placement and compaction of fill should be observed and tested.**

SLABS-ON-GRADE

We understand some portions of the plant improvements will require slab-on-grade floors and/or exterior paved walkways. The majority of the planned improvement area is covered with existing fill. We recommend removing the existing fill under slab-on-grade floors and replacing it with densely compacted, engineered fill as discussed above in the Fill Placement section of this report or remove existing fill and reuse it as compacted fill placed at high moisture content. The use of engineered fill under slab-on-grade floors will reduce the potential for damaging movement of slab-on-grade floors more than will the use of the soils from the existing fill.

If the existing fill soils are planned to be removed and replaced as compacted fill, after removal they should be moisture conditioned to 1 percent above to 3 percent above optimum moisture content (ASTM D 698), replaced in 8-inch maximum loose lifts and compacted to at least 95 percent of standard, maximum, dry density (ASTM D 698) with a heavy tractor towed roller or self-propelled compactor. The placement of this compacted fill should be observed and tested by a representative of our firm. In addition, we suggest:

1. Separating the floor slab from all foundation walls and foundations with a joint and provide reinforcement continuous through interior control joints;
2. Eliminating underslab plumbing where feasible or where such plumbing is unavoidable, place it in concrete pipe trenches and pressure test it during construction for leaks. Piping passing through floor slabs should be isolated from the slab;
3. Plumbing and utilities that pass through the slabs should be isolated from the slabs and/or constructed to permit movement of the slab without causing damage to either the slab or the utilities;
4. Separating exterior concrete flatwork and sidewalks from the structures. These slabs should be reinforced to function as independent units. Movement of these slabs should not be transmitted directly to the foundations of the structure; and

5. **Providing frequent control joints in all slabs to reduce problems associated with shrinkage. We recommend following the criteria set down by ACI.**

The above will not prevent damage should floor slab movement occur but such damage should be reduced for a comparatively small investment.

BELOW GRADE WALLS

All below grade walls should be designed for lateral earth pressures. Many factors affect the value of the design lateral earth pressure. These factors include, but are not limited to, the type, compaction, slope, and drainage of the backfill, and the rigidity of the wall against rotation and deflection. For a very rigid wall where negligible or very little deflection will occur, an "at-rest" lateral earth pressure should be used in design. For walls that can deflect or rotate 0.5 to 1 percent of the wall height (depending upon the backfill types), lower "active" lateral earth pressures are appropriate. Our experience indicates similar walls can deflect or rotate slightly under normal design loads and that this deflection results in satisfactory wall performance. Thus, the earth pressure on the walls will likely be between the "active" and "at-rest" conditions. Graphical presentations of typical lateral loading configurations are presented in Figure 7 of this report.

If on-site soils are used as backfill and the backfill is not saturated, we recommend design of foundation walls at this site using an equivalent fluid density of at least 45 pound per cubic foot (pcf) for the "active" condition. This value assumes deflection; some minor cracking of walls may occur. If very little wall deflection is desired, higher design density may be appropriate. Design for an "at-rest" condition should use an equivalent fluid density of 55 psf. We suggest assuming a "passive" equivalent fluid density of 250 pcf to calculate soil resistance. This equivalent fluid density does not include allowances for hydrostatic pressures or surcharge loads. The structural engineer should also consider site-specific grade restrictions on the behavior of the walls. If a drain is not installed the equivalent fluid density values discussed above will need to be

increased below the free water surface to account for the hydrostatic pressure acting upon the wall.

HYDROSTATIC UPLIFT

The plant additions are all anticipated to be above the groundwater levels encountered during our field testing. Buoyant force uplift caused by hydrostatic pressure is not expected to affect the structures as currently planned. If the planned structures change in the future to include facilities deep enough to be below the groundwater surface, hydrostatic uplift should be included in the design.

The effect of hydrostatic uplift will depend upon the relationships between the weight and elevation of the contents of a structure and the groundwater elevation at any given time. Floors for structures and tank bottoms will experience uplift when they are emptied for cleaning or maintenance or if they do not remain filled above the groundwater level.

Hydrostatic uplift can be relieved by a permanent dewatering system for individual structures, or they will need to be designed and constructed as a heavy, watertight structure capable of resisting a buoyant force consistent with a groundwater rise. We recommend a wet density of 120 pcf for backfill used to “weight” structures. However, backfill that is under water will be buoyant, reducing its density by the density of water. Hydrostatic uplift can be resisted by “tying” structures to deeper, competent soil layers. Anchors can be installed into the bedrock and attached to the structures.

PIPES AND UTILITY CONNECTIONS

Thrust Blocks

Thrust blocks should bear against undisturbed soil at least 3 feet below the ground surface. For thrust restraint, passive earth pressure theory is applicable. We suggest assuming an equivalent fluid density of 300 pcf and a net allowable soil bearing pressure of 2,000 psf to calculate soils resistance for the “passive” earth pressure condition.

Pipe Bedding

We believe sewer pipe is normally bedded in manufactured granular material in accordance with the pipe manufacturer specifications. We believe that sanitary sewer pipe bedding consisting of material that conforms to Larimer County or City of Loveland sanitary sewer design and construction requirements will meet typical requirements. We believe angular crushed rock, conforming to CDOT #67, specifications is usually acceptable bedding material. Squeegee or sand normally is not considered acceptable bedding material. We do not recommend the natural soils or the claystone bedrock encountered on the site be used as bedding material. We recommend bedding material meet current county specifications and be confirmed with the pipe manufacturer.

Modulus of Soil Reaction

We have been requested to provide the modulus of soil reaction (E') for flexible pipe wall design in accordance with ASTM F679 for the site soils. We have used our laboratory test data, and Table 3.4 of “Buried Pipe Design, Second Edition” (A.P. Moser, 2001), to estimate the modulus of soil reaction for the various soil types encountered below the site. We recommend the parameters presented in Table A below.

TABLE A
Modulus of Soil Reaction

Soil Type – Pipe Bedding (Unified Soil Classification)	E' for Degree of Compaction of Bedding (psi)			
	Dumped	Slight <85% Proctor, <40% relative density	Moderate 85-95% Proctor, 40-70% relative density	High >95% Proctor, >70% relative density
Claystone*	0	50	100	400
Sandy to Silty Clay (CL, ML)	50	200	400	1000
Clayey to Silty Sands (SC, SM) and Clayey Gravels (GC)	100	400	1000	2000
Gravelly Sands (SW) and Sandy Gravels (GW)	200	1000	2000	3000
Crushed Rock	1000	3000	3000	3000

NOTE: *Claystone should not be used as bedding material

ENVIRONMENTAL CORROSION

A sample of the clayey sand was tested for soluble sulfates and pH. Soluble sulfates were measured at 0.011 percent, and pH was measured at 8.6. The results of testing are summarized on Table I.

Concrete that comes into contact with soil and/or bedrock can be subject to sulfate attack. Sulfate concentrations less than 0.1 percent indicate Class 0 exposure to sulfate attack for concrete that comes into contact with the soils, according to the American Concrete Institute (ACI). For this level of sulfate concentration, ACI indicates any type of cement can be used in concrete that comes into contact with the soils.

In our experience, superficial damage may occur to the exposed surfaces of highly permeable concrete, even though sulfate levels are relatively low. To control this risk and to resist freeze-thaw deterioration, the water-to-cementitious material ratio should not exceed 0.50 for concrete in contact with soils that are likely to stay moist due to surface drainage or high water tables. Concrete should be air entrained.

SURFACE DRAINAGE

Performance of flatwork and foundations are influenced by changes in subgrade moisture conditions. Carefully planned and maintained surface grading can reduce the risk of wetting of the foundation soils and subgrade. We recommend the following precautions be observed during and maintained after the completion of the building:

1. **Wetting or drying of the open foundation excavation should be avoided.**
2. **Positive drainage should be provided away from foundations. We recommend a minimum slope of at least 5 percent in the first 10 feet away from the foundations in landscaped areas, where possible. Pavements and sidewalks adjacent to the building should be sloped for positive drainage away from the building. Water should not be allowed to pond on pavements.**
3. **Backfill around foundations should be moisture treated and compacted as discussed in Fill Placement.**
4. **Roof drains of adjacent structures should be directed away from the planned improvements. Downspout extensions and splash blocks should be provided at discharge points. Where downspouts discharge onto pavement, the pavement should be sloped away from the structure. If roof discharge is piped below slabs or flatwork, the pipes should be solid and glued at joints.**
5. **Landscaping should be carefully designed to minimize irrigation. Irrigation should not be located within 5 feet of the foundation. Sprinklers should not discharge within 5 feet of foundations. Irrigation should be limited to the minimum amount sufficient to maintain vegetation; application of more water will increase likelihood of slab and foundation movements.**

6. **Impervious plastic membranes should not be used to cover the ground surface immediately surrounding the building. These membranes tend to trap moisture and prevent normal evaporation from occurring. Geotextile fabrics can be used to limit weed growth and allow for evaporation.**

RESTORATION

Any pavements, sidewalks, curb and gutter, or other structures disturbed during construction should be replaced in accordance with Larimer County and City of Loveland requirements. Pavement repairs should meet, or exceed, existing pavement thickness in the area of construction.

Areas outside pavements should be graded following backfill to follow the contours and merge with adjacent terrain without noticeable breaks. Grading should be arranged to produce a reasonably smooth, well-drained finish with minimal erosion.

LIMITATIONS

Although our borings were spaced to obtain a reasonably accurate picture of subsurface conditions, variations in the soils and bedrock not indicated in our borings are always possible. We should observe pier hole drilling and footing excavations to confirm soils are as we anticipated from our borings. Placement and compaction of compaction fill, backfill, subgrade, and other fills should be observed and tested by a representative of our firm during construction.

This report was prepared from data developed during our field exploration, laboratory testing, engineering analysis, and experience with similar conditions. The recommendations contained in this report were based upon our understanding of the planned construction. If plans change or differ from the assumptions presented herein, we should be contacted to review our recommendations.

We believe this investigation was conducted in a manner consistent with that level of skill and care ordinarily used by members of the profession currently practicing under similar conditions in the locality of this project. No warranty, express or implied, is made.

If we can be of further service in discussing the contents of this report or in the analysis of the building and pavement from the geotechnical point of view, please call.

Preliminary Effluent Limits

Since this WWUP is not associated with any specific project, no project-specific preliminary effluent limits were obtained. The City will obtain preliminary effluent limits as required for future projects.

In February 2007, the City applied for a renewal of their existing discharge permit. The permit was due to expire on July 31, 2007. The City received a letter dated July 31, 2007 (enclosed) that the State was in receipt of the permit renewal application and that the WWTP should continue to abide by the limits of the existing permit until a new permit is issued. A new permit has not been issued to date. The permit renewal application is also enclosed.

**RE: Administrative Extension
WASTEWATER TREATMENT FACILITY
Permit No.: CO-0026701**

Dear Mr. Adams:

The discharge permit issued to you for your facility will expire on **July 31, 2007**. The Water Quality Control Division has determined that your application for renewal of the permit is complete. We are in the process of developing a renewal permit, but the review procedures required by law have not been completed. Accordingly, we are giving you notice by this letter that your previous permit remains in effect under Section 104(7) of the Administrative Procedures Act, C.R.S. 1973, 24-4-101, *et seq* (1982 repl. vol. 10).

All effluent limitations, monitoring requirements, and other permit terms and conditions in your current permit will remain in effect until your new permit is issued.

Sincerely,

Loretta Houk, Administrative Assistant
Water Quality Protection Section

Mr. Andrew Ross
Colorado Department of Public Health and Environment
Water Quality Control Division
WQCD-WQP-B2
4300 Cherry Creek Drive South
Denver, Colorado 80246-1530

Subject: Application for Permit Renewal
City of Loveland Wastewater Treatment Plant, Larimer County
CDPS Permit Number CO-0026701

Dear Mr. Ross:

Enclosed are three copies of the City of Loveland's application for renewal of the permit for its wastewater treatment plant, CDPS Permit No. CO-0026701.

The City requests a reduction in monitoring frequency in the renewal permit as allowed for in the Division's policy titled, "Baseline Monitoring Frequency, Sample Type, and Reduced Monitoring Frequency Policy for Industrial and Domestic Wastewater Treatment Facilities" based, at a minimum, on the City's participation in the Big Thompson Watershed Forum monitoring program. The City has been participating in this ambient monitoring program for eight years. We believe that this monitoring program meets the requirements for reduced monitoring frequency under "Ambient Water Quality Monitoring."

If additional information is needed, please contact John McGee of my staff at 970-962-3760 or myself with any questions.

Sincerely,

Stephen C. Adams
Water Utilities Manager

Permit Application

DOMESTIC WASTEWATER DISCHARGE APPLICATION

FOR AGENCY USE ONLY
PERMIT NUMBER

CO- / / / / / / / /

DATE RECEIVED

YEAR ___/MO. ___/DAY

Do not attempt to complete this form before reading the accompanying instructions.

PLEASE PRINT OR TYPE

SECTION I - GENERAL INFORMATION

1. A. Facility Name City of Loveland Wastewater Treatment Facility

B. This application is for [check the appropriate space(s):]

New permit _____ Renewal of existing permit X

Surface Water discharge X _____

Ground-Water discharge _____

(a) Impoundment _____

(b) Land Application _____

(c) Septic System >2000 gpd _____

C. Existing permit number (if applicable): CO-00 26701

D. Type of facility ownership (municipality, sanitation district, private individual, corporation, etc.)

Municipality

Federal Taxpayer (or Employer) ID#: 8 4 6 0 0 0 6 0 9

2. Name, address and telephone number of the legal owner of the wastewater treatment facility producing the discharge. Where the facility is owned by a city, town, special district, etc., provide the name of the ranking official (mayor, city/town manager, president, board chairman, etc.) who is legally registered with the Secretary of State's Office and in good standing or the names of any individual who is a part owner of the facility.

A. Legal Owner, Title Mr. Stephen C. Adams, Water Utilities Manager

B. Mailing Address 200 North Wilson Avenue

City Loveland State Colorado Zip Code 80537

C. Telephone Number (970) 962-3000

Area Code

3. Location of facility

A. Legal description (1/4, 1/4 Section, Township, Range, and latitude-longitude)

T5N, R68W, SE 1/4, NW 1/4, Section 19

B. Street Address (#, City, Zip Code) 920 South Boise, Loveland, Colorado 80537

C. County Larimer

4. Operator Information

A. Certified operator in charge (Name, Classification, and Number)

Mr. Michael McCrary (interim Wastewater Treatment Manager and Lead Operator), Class A Wastewater Certification No. 1214

B. Telephone Number (970) 962-2572

Area Code

C. Is the facility operated by an individual or a company through a written contract? Yes ___ No X

If yes, complete the following:

Operator Not applicable

Mailing Address

City _____ State _____ Zip Code _____

Telephone Number (_____)

Area Code

D. Submit a copy of any owner/operator agreements which are currently in effect or that are scheduled to be in effect during the life of the permit. Not applicable.

SECTION II - SERVICE AREA AND POPULATION

5. Unless this is a renewal of an existing permit and the service area has not changed since the previous application, provide an 8 1/2 x 11 inch map which defines the legal boundaries of the service area. See Attachment A for a map of the service areas.

6. Provide a breakdown of the number and type of existing taps in the service area as follows:

<u>Type of Tap</u>	<u>Number</u>	<u>Description (attach list if necessary)</u>	<u>Total Estimated Flow*</u>
<u>Residential</u>	<u>21,046</u>	<u>Residential Taps</u>	<u>5.0 MGD</u>
<u>Industrial</u>	<u>278</u>	<u>See Attachment B</u>	<u>0.08 MGD</u>
<u>Commercial</u>	<u>2,296</u>	<u>See Attachment B</u>	<u>0.8 MGD</u>

Other (specify)

* Total estimated flows are based on the proportioned consumptive water use for 2006 for each type of tap and an average flow at the WWTP of 5.9 MGD.

All facilities with a design flow of 1 MGD or greater shall provide a list of non-residential customers which includes the name, address and type of business. See Attachment B

7. What is the population of the service area? 65,000

8. Municipalities or Areas Served

Identify any agreements, for the acceptance and treatment of wastewater, with connector systems, districts, subdivisions, counties, cities, or other agencies or persons within or outside the defined service area.

None. No connector districts

SECTION III - FLOWS AND DISCHARGES

9. Provide the following data on influent flows to the facility during the past calendar year. Effluent flow data may be substituted where that is no influent flow measuring and recording or totalizing device.

Average daily flow (MGD) during the three minimum flow months. month February month March month April
 flow 5.25 flow 4.82 flow 5.30

Average daily flow (MGD) during the three maximum flow months. month June month July month Aug
 flow 6.90 flow 6.81 flow 6.89

Maximum peak hourly flow (MGD) 13.5 MGD

10. For each surface water discharge point from the treatment facility indicate the type of discharge (continuous, intermittent, seasonal, etc.), legal description (1/4 of 1/4 Section, Township, Range) and the name and description of the receiving water for each.

<u>Outfall Number</u> <u>(Existing Permit)</u>	<u>Legal Description</u> <u>(T, R, S, 1/4, 1/4)</u>	<u>Typical Months of Discharge</u>	<u>Receiving Water</u>	<u>Latitude/Longitude of each outfall</u> <u>Method Used</u>
<u>001A</u>	<u>T5N, R68W, Sec. 19, SE 1/4, NW 1/4</u>	<u>Continuous</u>	<u>Big Thompson River</u>	<u>40° 23' 03.16" / 105° 03' 07.40"</u>

11. For a discharge to a ditch provide a copy of: 1) any agreement with the ditch owner which authorizes the discharge and; 2) the notification to the owner that this application is being made and a copy sent to the Division.

Not Applicable

12. Does facility accept septage? If yes, provide description of procedures and quantities.

Septage is not accepted at the plant.

13. Is or will land application of any wastewater be practiced? Yes ___ No X

If yes, answer question 14. If no, go to question 15. Nonpotable waters are used for irrigation of the plant site.

14. Provide the information requested in Appendix D and D-2. Not Applicable

The Division may request additional information before the permit can be issued.

15. Bypassing and Overflow Points for Surface Water discharges and for Ground-Water discharges, as appropriate

A. On a separate sheet, provide a diagram/map illustrating 1) the location of any bypass and/or constructed overflow point(s), 2) the receiving water, and 3) a description of any bypass and/or constructed overflow point(s) at the treatment facility that are not described in a current permit for the facility. Also provide this information for any lift station or any point in the collection system.

See Attachment C for a process flow schematic for bypasses at the treatment facility. The only overflow points, designated as OF on the schematic, occur after preliminary treatment and bypass primary and secondary treatment. Secondary settling and disinfection treatment would still occur for the overflow.

There are no known bypasses or overflows to receiving waters that can occur in the collection system. However, there are three lift stations that have overflows to containment areas. These include the East Side Lift Station, the Horseshoe Lake Lift Station, and the Mountain View Lift Station, as described below.

- East Side Lift Station: 148,000 gallon retention pond and 138,000 gallons of interceptor (used in case all back-up pumps and power fails). Provides an average of 3.0 hours of retention time.
- Horseshoe Lake Lift Station: This Duplex lift station is equipped with two secondary wet well storage manholes upstream of the lift station wet well. In the event of a power outage and standby generator failure, the secondary wet wells would begin to fill. The secondary wet wells have a total volume of 7,370 gallons, which provides a storage time of 2 hours based average design flow.
- Mountain View Lift Station: This duplex station is equipped with a single secondary containment manhole upstream of the lift station wet well. In the event of a power outage and standby generator failure, the

secondary containment will begin to fill. The secondary containment has a total volume of approximately 3,000 gallons, which would provide a storage time of about 3 hours at average design flow.

- B. Include a general discussion of what conditions would cause a discharge from any such point to occur. There are no locations where a bypass can occur directly to the River. A loss of the influent screw pumps at the treatment facility, such as from a power outage would cause a controlled overflow to occur after preliminary treatment. The waters would go to the final clarifiers where some settling would occur and flow through the UV disinfection facilities. Standby power is provided for the UV disinfection facilities and the WWTP has dual electric circuits that are manually switched following an outage.

It is unlikely that a discharge to a receiving water would occur from any of the lift stations. See the answer to Question 23.C regarding the emergency systems in place to prevent a discharge from the lift stations.

16. Submit a location map showing the facility property and discharge points. The map shall be from a 7-1/2 or 15 minute USGS quad sheet or a map of comparable scale. A north arrow shall be shown. Any public water supply intakes within a 5 mile radius of the facility shall also be identified.

See Attachment D. Please note that there are no public water supply intakes on Big Thompson River within a five-mile radius of the discharge point. The Greeley water supply intake is in Boyd Lake.

17. Submit a diagram of the site which shows appurtenant facilities (buildings, ponds, diversion ditches, treatment processes, etc.), the stream location, numbered discharge points, influent monitoring and effluent compliance sampling points, bypass points and flow monitoring points. The diagram shall be 8 1/2 x 11 inches. A separate treatment process flow schematic may also be submitted.

See Attachment E for the site layout map.

SECTION IV - RECEIVING WATER INFORMATION

18. Is analytical data required to be submitted? Yes ___ No ___

If yes, see Appendix G*

No parameters were checked in Appendix G. Per Lynn Kimble, if no parameters are checked then no samples are required. However, the Big Thompson Watershed Forum and the USGS have been implementing a monitoring program along the Big Thompson River. This program includes a monitoring station upstream of the City of Loveland Wastewater Treatment Facility. The results of the upstream monitoring can be found on a CD in Attachment F. No separate sampling was performed for the application.

Sample Effluent Yes ___ No ___ No parameters were checked in Appendix G.

Sample Upstream of the discharge point Yes ___ No ___ No parameters were checked in Appendix G. However, upstream data are included on a CD in Attachment F.

*Parameters indicated by an "x" in Appendix G shall be submitted from at least one composite sampling (grab sampling for lagoons) of each discharge point plus at least one representative sample of state waters upstream of each discharge. See instructions accompanying this application for more information on sampling.

19. Provide a copy of any studies or other analyses which you feel may help the Division in its development of effluent limitations for your facility. This would include sampling data for pH and temperature, instream sampling and analyses upstream or downstream of the discharge, modeling results, etc. If this information has previously been submitted, provide a copy with this renewal application. See Attachment F.

SECTION V - TREATMENT FACILITIES AND SEWER SYSTEM

20. Treatment Facility Design Capacity

- A. Provide design calculations and other engineering data which define the organic and hydraulic capacity of each unit process and the facilities as a whole. If this information was provided with the application for an existing permit, then provide information on any changes or additions at the facility since that time. Plans and specifications and engineering design studies must be certified by a registered professional engineer. Upgrades have been made to the wastewater treatment plant as well as a rerating of the plant to 10 MGD. See Attachment G for unit design capacities.

- B. *When did the facility first begin operating?* 1963 – The last time the WWTP was modified was in 2006 and the ongoing modifications are due to be completed in the spring of 2007.
- C. *If this is a lagoon system, please provide verification that the lagoons are lined and provide information pertaining to the liner. Do these lagoons meet the allowable seepage rate requirement of less than or equal to 1×10^{-6} cm/sec? If the lagoons do meet the allowable seepage rate, please submit documentation showing this information. (Also, see Appendix D and D1 of this application.)*
Not applicable.
- D. *Has there been an expansion or rerating of the facility since the last permit was issued? Yes No*
The City submitted an application for site amendment to rerate the plant for an increase in the permitted flow. The rerating is dated in October 2004, and corrections to the permit were made in June 2005.
- E. *Date(s) and Number(s) of the original site approval for the facility and any amendments.*
The plant was originally constructed in the 1950's. The City has been unable to locate the original site approval. The most recent site application was approved May 21, 2003 and amended February 2, 2006.

21. Collection System-Infiltration/Inflow

- A. *Does the 30-day average flow to the facility exceed 120 gallons/capita-day during any month? Yes No*
If so, attach a discussion of the extent of the problems (quantities, sources, etc.) and any ongoing or proposed correction programs (including scope and budget of programs). Attach a copy of the pertinent portions of any I/I studies which have been completed.

Per capita flows have not exceeded 120 gallons/capita-day since 1999. The City is not currently performing any I/I studies.

- B. *Attach a description of any ongoing sewer system maintenance/repair/rehabilitation programs.*
The City has an annual contract with Dale's Environmental Service (DES) for cleaning and inspecting sewer lines. The annual contract is for \$135,000 at a unit price of \$0.35 which equates to approximately 386,000 feet or 73 miles of sewers contract cleaned each year. Of the 73 miles cleaned, DES will inspect 10% or over 7 miles of the sewers using closed circuit television. The City also contracts with DES for up to \$35,000 per year to conduct additional inspection using closed circuit TV. The City also uses their own crews for cleaning and inspecting sewer lines as required for new connections and regular maintenance. This maintenance and inspection program has greatly improved the conditions of the City's collection system over recent years.
- C. *Attach a description of any ongoing interceptor flow monitoring programs if such data is collected. Include a description of monitoring techniques, the locations of monitoring points and any pertinent data.*
The City is not currently performing any ongoing interceptor flow monitoring programs, nor are there any plans to perform an ongoing interceptor flow monitoring program at this time.

22. *Are any facility or collection system (I/I reduction) expansions or improvements planned during the next five years? If so, describe the extent of the expansions/improvements and list any proposed schedules for planning, design and construction.*

The City is planning a rehabilitation / replacement program aimed at "renewing" the wastewater collection system. The major driving forces for this program are to rehabilitate any identified deteriorated sewers (caused by corrosion), reducing I/I, and restoring sewer capacity. Additional funding through a recent rate increase will be devoted to this endeavor. By taking on this program, I/I will be reduced as will other problems associated with maintaining a wastewater collection system. Over the next 5 years, the City is projecting (not yet budgeted) over \$3.2 million on this rehabilitation program. In the summer of 2006, the City of Loveland rehabilitated approximately 3,000 feet of the Fairgrounds Interceptor (30 and 33-inch diameter) and approximately 2,000 feet of 8 to 15-inch diameter sewer lines within the collection system. The rehabilitation was performed using cured in place pipe (CIPP) technology to repair damage due to corrosion and reduce infiltration. A comparison of the pre CIPP and post CIPP video inspection results indicate that the CIPP successfully eliminated the infiltration and restored the capacity of the interceptor.

23. Lift Stations

A. Provide the following information for all lift stations in the service area:

Lift Station Name/No.	Wet Well Volume	# of Pumps and Capacities (gpm and hp)	Current Peak Daily Flow* (MGD)
Fire Station #2/Taft	9,675 gal	2 @ 10hp/ 600 gpm	0.20
Barberry (Cashway Lumber)	338,650 gal	2 @ 5 hp/70 gpm	0.0036
Lakeside Terrace	5,830 gal	2 @ 7.5 hp/100gpm	0.032
Bus Barn (North Lake Estates)	7,640 gal	2 @ 5 hp/125 gpm	0.032
West 29 th Street	8,395 gal	2 @ 5 hp/125 gpm	0.028
North Horseshoe	7,520 gal	2 @ 10 hp/ 386 gpm	0.087
South Horseshoe	19,825 gal	2 @ 20 hp/1100 gpm	0.23
Horseshoe Lake	1,100 gal	2 @ 5 hp/175 gpm	0.021
South Side	31,050 gal	3 @ 40 hp/1,859 gpm	0.11**
Boyd Lake	4,335 gal	2 @ 5 hp/150 gpm	0.016
East Side	10,000 gal	2 @ 100 hp/3600 gpm	1.30
Mountain View	1,100 gal	2 @ 3 hp/100 gpm	0.0018
Boedecker	3,085 gal	2 @ 5 hp/80 gpm	0.011
Mariana Cove	7,520 gal	2 @ 3 hp/42 gpm	0.0056
Lakes Place 4 th	9,960 gal	2 @ 3 hp/ 390 gpm	0.022

* Reported are the current estimated daily discharges for a peak day as calculated based on run time and pump capacity. Pump capacity is based on the rated capacity for the lift station. For duplex stations only a single pump is in service.

** South Side Lift Station is operated at 60% speed (1100 gpm), which was used to determine the estimated daily discharge.

B. Include a map which shows the locations of the lift stations. The service area map requested in Question 5 of this application may be used in place of a separate map. See Attachment H.

C. Describe the emergency systems in place (alarms, dual grid power feed, generators, holding ponds, etc.) which will be used to prevent a discharge from any lift station.

All lift stations are equipped with standby generators. In the event of a loss of power, an automatic transfer switch will activate the standby generators. If the standby generator would fail, then there could possibly be a lift station overflow once all secondary containment vessels are full. The likelihood of this happening would be very remote. One lift station in the City does not have emergency power, which is the Barberry Station near Cashway Lumber. If this station fails, a high water alarm is activated and the City can respond with a mobile generator for emergency power. All lift stations in the City are remotely monitored by the City SCADA system (RS View with radio/telemetry signal). Each lift station is monitored for pump failure, pump ON/OFF, pump run hours, high water alarm, level in wet well, emergency power ON/OFF, and primary power ON/OFF. The East Side Lift Station is also equipped with a flow meter and is remotely monitored for flow.

SECTION VI - OPERATION AND MANAGEMENT

24. Provide the following information for the facility. A current plan of operation which includes this information may be substituted.

A. A copy or description of the staffing plan for the facility, including the number of operators and their certification levels, and operating personnel coverage of the facility during weekdays, weekends, and holidays. See Attachment I

B. A discussion or outline of the emergency response program used at the facility. This discussion should include:

1. A description of alternate power sources. See Attachment I
2. A discussion of alarm systems installed at the facility, including any remote transmission of alarms. See Attachment I
3. A description of the chain of command in emergency situations. See Attachment I
4. Provide any other information for emergency response. See Attachment I

Provide these details on separate sheets. If information is not available for any of these items please indicate that this is the case and provide a brief explanation of why the item cannot be discussed or described.

- C. Attach a list of any chemicals which are used in the operation of the treatment facility. This includes chemicals added directly to the treatment process (chlorine, copper sulfate, other algicides, alum, etc.) as well as chemicals which are used adjacent to unit processes (ponds, basins, etc.) which may be carried into the treatment system by storm events, snowmelt, etc. MSDS sheets shall be included for any name-brand (Aquashade, Round-up, etc.) products.
See Attachment J for a list of chemicals used at the treatment facility and for the Material Safety Data Sheets.

25. Monitoring and Testing

- A. Describe the method of flow measurement for the influent flow to the facility and for each discharge (i.e., V-notch weir, 3-inch Parshall flume, calibrated pumping rate with run-time meter, none, etc.). Also, describe the "range" (minimum-maximum) of any flow metering and recording equipment associated with these devices.
The flow monitoring is unchanged from the previous permit application and is summarized in the table below.

Monitoring Point	Type of Device	Size	Range of Flows Measured	Type of Recorder Meter (if any)
300I (Influent)	Parshall Flume	24 inch	0.273 MGD to 21.4 MGD	Ultrasonic Open channel flow transmitter. It also totalizes readout.

- B. Describe procedures and tests used to determine the accuracy of the flow measuring and recording devices and note how often the devices are calibrated.

Device	Method	Frequency
24 inch Parshall Flume with Ultrasonic flow sensor	No calibration is done to the flume. For the sensor, if a trend of variation over 10% is noted between the manually measured flow from the flume and flow measured by the sensor, the flow sensor unit is recalibrated by the City's Technical Services department. The flow sensor reports alarms and error codes to the operators if there is a system malfunction. Recalibration is performed as necessary to respond to system alarm messages. Recalibration has not been required to date.	The flow sensor reading is checked against a manual measurement of flow from the Parshall flume once per week. Preventive maintenance work is done once per year. This includes checking all electric outputs and calibrations in addition to physical inspection for corrosion, dirt, and moisture.

- C. Attach a description of approved analytical procedures which are used, or will be used, for analyzing each influent and effluent parameter in order to meet the reporting requirements of the permit. Also, describe the location where each analysis is or will be completed and the requirement used for each method not done in the lab. (i.e., BOD₅-Method 5210B from Standard Methods, etc.) Is a commercial or other WWTP laboratory used? If so, identify the laboratory and submit their analytical methods for each parameter.
See Attachment K for analytical procedures used for influent, effluent and solids analysis and Attachment M for analytical procedures used for the pretreatment program.

26. If this application is for renewal of an existing permit and any violations of effluent limits occurred during the period of such a permit, are there any administrative, design, operational, or financial deficiencies which would prevent the applicant from eliminating such violations prior to the issuance of the renewal permit? Yes ___ No X

The applicant shall answer yes if any such deficiencies were previously identified (engineering report, Division inspection, etc.) and have not been eliminated at this time.

There have been no flow limitation violations during the period of the existing permit.

- A. If the answer to the above question is yes, then a written report must be included which describes how and when

the deficiencies will be eliminated.

SECTION VII - BIOSOLIDS HANDLING - BENEFICIAL USE OR DISPOSAL

27. If facility is a lagoon, last time solids were removed? Month _____ Year _____

Will biosolids be removed within the next 1-5 years? Yes _____ No _____

Anticipated date of removal: Year _____

Not applicable

28. For a mechanical facility, please attach a short narrative description of the type of treatment (i.e. Class A or Class B), beneficial use (i.e. land application, composting) as described in EPA 503 Regulations/Colorado Biosolids Regulations #64, or disposal method(s) (i.e. landfill, transported to another facility) which are to be utilized.

See Attachment L.

29. Are biosolids being stored at the facility? For how long? No solids are routinely stored on site.

See Attachment L

30. Will a contract hauler be utilized? Yes
If yes, please give name and frequency used. See Attachment L.

31. Please attach a short narrative description on contingency plan for biosolids beneficial use and or disposal practice(s).

See Attachment L.

32. Describe the handling and final disposal method of screenings, grit and any other similar types of material at the facility (i.e. landfill, surface disposal, certificate of designation, storage).

See Attachment L.

SECTION VIII - INDUSTRIAL CONTRIBUTORS AND PRETREATMENT

33. Are industrial wastes, which contain any of the toxic pollutants or hazardous substances listed in Appendix A or B or are from any categorical industry listed in Appendix C, discharged to the sewer system? Yes X No _____
Are there any facilities for acceptance of wastes, other than domestic septage, by rail, truck or dedicated pipeline? Yes _____ No X

If the answers to these questions are no, then answer question 33.B. only.

A. On a separate sheet, list any of the pollutants found in Appendix A and B which you know or have reason to believe are present in or may be present in the influent to the facility. For every pollutant you list, briefly describe the reasons you believe it to be present and report any analytical data (influent or effluent) in your possession (use separate sheets). If this information has been previously submitted to the Division, please indicate the date of the submittal and who in the Division it was sent to.

See Attachment M.

B. Has a list of industrial contributors, including both those referenced in Appendix C and any non-categorical industries, been previously submitted? Yes X No _____

A list of industrial contributors is included in Attachment B in response to question 6 of this application.

1. Identify any industries contributing industrial process wastewater that were not covered by previous submittals.

Woodward Governor Company, 3800 North Wilson Ave., metal finisher

2. Provide procedures for identifying new industrial/commercial dischargers.

Procedures for identification of new industrial users involve various different activities. These are listed in Attachment M.

C. Has an assessment of the quantity and quality of any industrial process wastewater contribution been previously submitted? Yes ___ No X

1. If no assessment has been submitted and is presently available, please provide the data on an attached sheet. The combined domestic and process waste stream from McKee Medical Center was sampled in June of 2006. See Attachment M for the results of the sampling.

2. Has any additional data for industrial wastewaters been compiled which was not previously submitted?

Yes ___ No X If yes, please provide the data on an attached sheet.

D. If not previously submitted to the Division, provide the following on separate sheets:

1. A discussion of pretreatment provided by each significant industrial user and/or specific treatment, if any, provided at the domestic treatment plan for any industrial waste received. See Attachment M
2. The estimated degree of reduction in the domestic facility of any relevant pollutant listed in Appendices A and B. See Attachment M
3. A summary or outline of the procedures for monitoring and testing of industrial pollutants generated in the service area. See Attachment M
4. A copy of any pretreatment ordinances and user charge schedules applicable to industrial contributors. See Attachment M
5. A discussion of any problems encountered with contributed industrial wastes and how these problems have been handled. See Attachment M

SECTION IX - CERTIFICATION

I certify under penalty of law that I have personally examined and am familiar with the information submitted in this application and all attachments and that, based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the information is true, accurate and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment.

SECTION IV - RECEIVING WATER INFORMATION

18. Is analytical data required to be submitted?

No analytical data is required to be submitted. However, the Big Thompson Watershed Forum (BTWF) and the USGS have been implementing a monitoring program along the Big Thompson River. This program includes a monitoring station upstream of the City of Loveland Wastewater Treatment Facility. The results of the upstream monitoring can be found on the attached CD. The CD includes data from the BTWF website and from the USGS website. The period of record for the data is approximately from 2001 through 2006 for the BTWF data and 2000 through 2005 for the USGS data. Because the BTWF and the USGS work in conjunction with this monitoring, there may be duplicate data between the two databases. The following table summarizes what parameters are included in each database.

Upstream Water Quality Parameters

BTWF Database	USGS Database
Alkalinity	Alkalinity
Hardness	Hardness
Carbonate as CO ₃	Carbonate
Bicarbonate as HCO ₃	Bicarbonate
Dissolved ammonia	Dissolved ammonia
Total ammonia plus organic nitrogen	Dissolved nitrite
Nitrite plus nitrate	Total ammonia plus organic nitrogen
Dissolved oxygen	Nitrite plus nitrate
Total phosphorus	Dissolved oxygen
Dissolved phosphorus	Total phosphorus
Orthophosphate	Dissolved phosphorus
Total organic carbon	Orthophosphate
pH	Total organic carbon
Calcium	pH
Magnesium	Calcium
Sodium	Magnesium
Potassium	Sodium
Chloride	Potassium
Sulfate	Chloride
Specific Conductance	Sulfate
Temperature	Fluoride
Turbidity	Silica

City of Loveland – Design of Wastewater Secondary Clarifier and Digester Renovations (Project W434HG)

Process Analysis

PREPARED FOR: City of Loveland
PREPARED BY: Anne Childs/CH2M HILL
DATE: April 22, 2005 (revised June 3, 2005)

Purpose and Background

This technical memorandum (TM) describes the results of a detailed process analysis of proposed liquid stream modifications to the existing Loveland Wastewater Treatment Plant (WWTP), defined as Project I in the Wastewater Reclamation Site Feasibility/Incremental Expansion Study (1999 Study). Proposed modifications to the secondary treatment system include the addition of a third clarifier, associated return activated sludge (RAS) and secondary scum (SSM) pump stations, and a new clarifier influent flow splitting structure.

The City of Loveland recently completed a significant modification to the secondary treatment process at the Loveland WWTP. These projects are defined as Projects A3 and B (Step Feed Aeration and UV Disinfection), and are described in the 1999 Study. A previous process analysis was completed as part of those projects and is documented in the technical memorandum "City of Loveland Wastewater Treatment Plant Project A3 – Step Feed Aeration Conceptual Design" dated November 27, 2002 (2002 Process Analysis).

The current analysis builds on the 2002 Process Analysis. In particular, the computer model of the plant that was previously developed using CH2M HILL's Professional Process Design System (Pro2D) process model was updated to reflect the recently completed step-feed activated sludge configuration. At the time the 2002 Process Analysis was completed, the design of modifications to the secondary treatment system was not complete. In addition, certain modifications to the design were made during the construction phase. These modifications have been incorporated into the plant model under the current study to provide an accurate representation of the plant's current secondary process facilities.

Recent Step-Feed Project Background

The recently completed Project A3, Step-Feed Aeration, consisted of improvements to the activated sludge, diffused air aeration, and RAS pumping facilities. Improvements included the addition of two new aeration basins and modifications to the existing basins, with a resulting configuration that provides step-feed treatment configured as two trains of three consecutive basins; addition of anoxic zones at the head of each basin to provide partial denitrification; replacement of existing with new secondary aeration fine-bubble diffusers and blower system; and replacement of the existing RAS pumping units. In addition, it was determined that the existing trickling filters were no longer necessary due to the expanded

aeration basin capacity, and they were removed from service on December 9, 2004, to help with odor control issues at the WWTP.

The primary function of step-feed operation is to allow higher influent loadings than with a conventional complete mixed operation, while limiting solids loadings to the secondary clarifiers. This is accomplished by feeding all of the return activated sludge (RAS) to the first upstream zone, while feeding the influent in a step-wise manner, split among the three aeration zones. As a result, the two upstream aeration zones are operated at higher mixed liquor suspended solids (MLSS) concentrations, while the last downstream zone, which determines the clarifier loadings, is operated at the same MLSS concentration as with a conventional activated sludge system. The higher upstream MLSS concentrations provide a greater total sludge inventory, which in turn can accommodate higher loadings and/or allow operation at a higher sludge age, or SRT. As a result, nitrification, which requires a certain minimum SRT, can still be accomplished even with higher influent loadings.

Construction of the two new basins and modifications to two of the existing basins were completed in July of 2004. The WWTP step-feed process was put on-line on July 20, and initially consisted of one train in a modified configuration. The configuration consisted of two basins in series followed by a third group in which mixed liquor and primary effluent flow was split to two basins as shown in Figure 1:

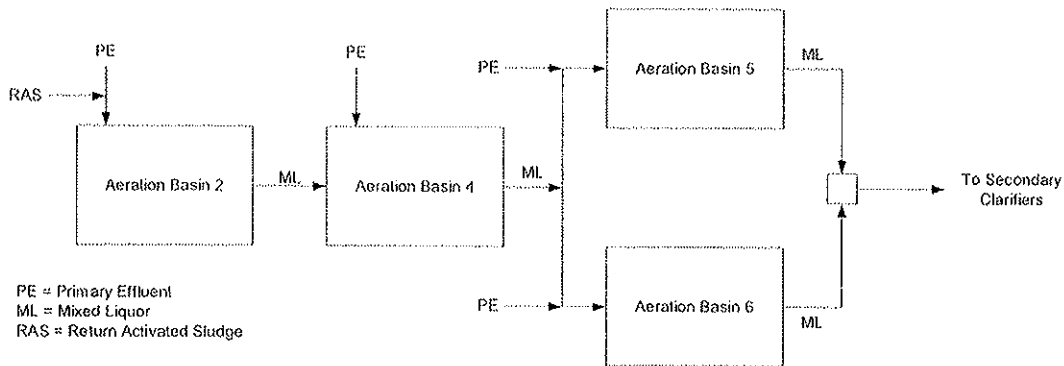

FIGURE 1
 Modified Step-Feed Process During Construction of the WWTP Improvements

In September 2004, modifications to the remaining two basins were complete and the basins were put on line to provide two trains of three basins in series as shown in Figure 2:

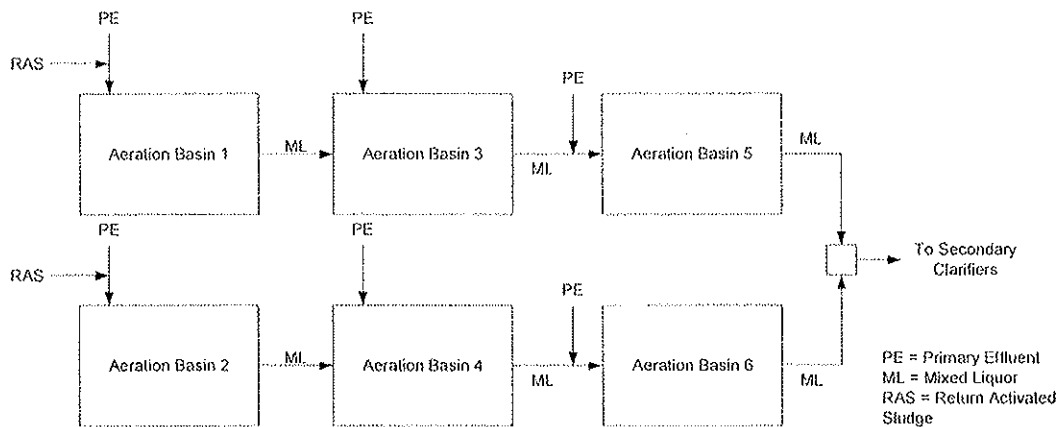

FIGURE 2
Final Step-Feed Process for the Loveland WWTP

Table 1 presents the summary of plant performance for the years 2003 and 2004. The average influent flows in million gallons per day (mgd) and the influent and effluent concentrations in milligrams per liter (mg/L) for biochemical oxygen demand (BOD), total suspended solids (TSS), and ammonia (NH₃) were obtained by averaging the daily effluent parameters included in the "DLYPAR" files provided by the City. These files are presented in Appendix A. Note that throughout this TM, the acronym "BOD" is synonymous with "5-day BOD", or "BOD₅".

TABLE 1
Summary of Plant Performance for 2003 and 2004

Month	Average	Average Influent Parameter, mg/L			Average Effluent Parameter, mg/L

⁽²⁾ 6 basin step-feed on-line 09/07/04

If the average effluent parameters for the corresponding months in each of the two years are examined in Table 1, it appears that the step-feed process has resulted in an approximate one-half decrease in monthly average effluent BOD concentrations. More importantly, a significant decrease in effluent ammonia concentrations was observed during the colder winter months. This is because the step-feed process allowed operation at a higher SRT than was possible with the previous conventional activated sludge system, as limited by clarifier loadings. Although the City runs a lower MLSS than was previously run to the secondary clarifiers, the average MLSS concentration is higher in the overall process due to the MLSS gradient across the basin. This gradient is experienced because the concentrated RAS is returned to the first basin in each aeration train and is subsequently diluted in each basin by the incoming primary effluent, until it reaches its minimum value in the last basin. The higher average MLSS concentration corresponds to a longer overall SRT.

Process Model Development

The model of the CITY's WWTP unit processes developed for the 2002 Process Analysis was updated using CH2M HILL's Pro2D modeling tool. The modeling effort for the 2002 Process Analysis included an analysis of the existing treatment facilities and wastewater flow and loading characteristics and operating parameters. The model was used to estimate the fate of key wastewater constituents such as BOD, ammonia, and nitrate through each unit process at the WWTP, and to develop a solids balance through the existing plant for the proposed Project A3 improvements. This model has been updated for the current study to

include the changes made to the existing facilities as a result of the construction of the Project A3 improvements as well as the addition of the secondary clarifier facilities proposed under the Project I improvements.

Model Revisions

Revisions to the Pro2D model developed for the 2002 Process Analysis included both physical and operational changes as follows:

- Removal of the trickling filters, which were taken out of service on December 9, 2004.
- Adjustment of the sizes of the individual aeration basins to account for changes made during construction.
- Addition of a third secondary clarifier equal in size to the existing clarifiers.
- Adjustment of the basic process parameters in accordance with the model calibration described in subsequent paragraphs.
- A decrease in the expected primary concentrations based on the plant performance data from 2003 and 2004. The average primary sludge concentration over the last two years is approximately 3 percent. This is 0.5 percent lower than observed during our original analysis.
- A decrease in the expected WAS thickening capture rate based on the plant performance data from 2004.

Model Calibration

The observed effluent parameters presented previously were somewhat better than those predicted by the Pro2D modeling efforts in the 2002 Process Analysis. As such, efforts were made to recalibrate the model for the constructed step-feed facilities based on reported data provided by the plant operators from the following representative operating periods:

- September 20-26, 2004
- October 9-15, 2004
- November 22-28, 2004
- December 23-29, 2004 (w/o trickling filters)

To calibrate the model, the average influent and operating conditions for each period were entered into the model, including flows and loads, and the operating dissolved oxygen (DO) level, solids retention time (SRT), and return sludge flow. All parameters were obtained from data taken from the "DLYPAR" or "DLYAS" files.

Data used to calculate SRT, in days, was obtained from the "DLYAS" files, and included the aerobic aeration basin volume and mixed liquor suspended solids (MLSS); WAS flow and solids concentration; effluent flow and TSS. Daily SRT was calculated based on the following equation:

$$SRT, \text{ days} = \frac{V * X}{(Q_w * X_r + Q_e * X_e)}$$

where:

- V = Aerobic aeration basin volume, million gallons (MG)
- X = Aeration basin MLSS concentration, mg/L
- Q_w = WAS flow, mgd
- X_r = WAS solids concentration, mg/L
- Q_e = Effluent flow, mgd
- X_e = Effluent TSS, mg/L

Basic process parameters in the model were adjusted within ranges acceptable in the industry until a close approximation to the observed effluent ammonia levels, MLSS concentration, and air flow for the specific period was achieved. These process parameters were then averaged for all of the periods analyzed to establish the parameter values for the calibrated model. Using the calibrated model, the operating characteristics for the four periods were input to confirm that the model reasonably predicted the observed performance. The model calibration results are presented in Appendix B.

Secondary Treatment Process Capacity Evaluation

The calibrated model was used to evaluate capacity and performance capabilities of the proposed secondary treatment unit processes at the Loveland WWTP with respect to the City's current Colorado Discharge Permit System (CDPS) permit for the plant. Year-round nitrification is necessary to achieve compliance with the permitted whole effluent toxicity (WET) limits and to reliably meet the numeric limits for ammonia listed in the discharge permit. The WET limit in the current CDPS permit for discharge into the Big Thompson River is: No lethality at an 86 percent in-stream waste concentration (IWC). Using an estimated zero-lethality concentration of 8 milligrams per liter (mg/L) of ammonia, per CH2M HILL's laboratory data, and dividing it by 0.86, results in a limit of 9.3 mg/L in 100 percent effluent. Interpreting this as a daily maximum limit, and dividing by a typical treatment variability factor of 2.2, results in an average target ammonia concentration of approximately 4 mg/L. Therefore, it was assumed in this study that the treatment target is a mean ammonia concentration of 4.0 mg/L during all seasons.

As discussed in the 2002 Process Analysis, since the model predicts WWTP nitrification performance under steady-state, ideal operating conditions, it cannot be used directly to assess plant operational constraints for a desired annual mean effluent ammonia value. Instead, a minimum operating SRT must be determined for the wastewater conditions of concern (primarily temperature and dissolved oxygen concentration). The analysis of historical plant data presented in the 2002 Process Analysis determined a conservative operating factor of 1.71 for a target effluent ammonia concentration of 4.0 mg/L. This operating factor is applied to the minimum theoretical SRT for nitrification to determine the operating SRT for the analysis.

Three seasonal models were developed to account for differing wastewater temperatures and loading parameters observed throughout the year as follows:

- Winter January-March
- Spring/Fall April-June & October-December
- Summer July-September

For each of the seasonal models, the OF of 1.71, along with an assumed DO concentration of 2.5 mg/L in the aerobic zone of each basin, was used to establish the operating SRT in the model. Seasonal flow rates were established by assuming a maximum month design flow of 10.9 mgd, and multiplying it by the corresponding historical seasonal to maximum month flow ratios to get seasonal design flow rates for the model runs. Influent TSS, ammonia, and total Kjeldahl nitrogen (TKN) concentrations were also adjusted in the model to relative to the incoming BOD loadings based on a comparative analysis of historical plant data. With the operating conditions established for each of the three seasonal models as shown in Table 2, the models were run with incrementally increasing BOD loadings at the seasonal flow which corresponds to a maximum month design flow of 10.9 mgd, and at the SRT determined as described above to meet a target effluent ammonia concentration of 4.0 mg/L, until a maximum clarifier solids loading rate of 25 pounds per day per square foot (lbs/day/sq ft) resulted. The RAS rate for the analysis was assumed to be 100 percent of the peak month flow, or 10.9 mgd. In addition aeration requirements were not allowed to exceed the firm capacity of the installed aeration blowers of 10,300 scfm.

TABLE 2
Seasonal Influent and Operating Conditions for Capacity Assessment

Season	Influent Parameter	Value
Winter	Flow, mgd (average)	8.3
	Temperature, deg C	12.5 (12.3) ^a
	Required SRT, days	10.1
	Ratio of influent TSS to BOD	0.88
	Ratio of influent Ammonia to BOD	0.084
	Ratio of influent TKN to BOD	0.128
Spring/Fall	Flow, mgd (peak month)	10.9
	Temperature, deg C	14.0
	Required SRT, days	8.4
	Ratio of influent TSS to BOD	0.87
	Ratio of influent Ammonia to BOD	0.087
	Ratio of influent TKN to BOD	0.127
Summer	Flow, mgd	10.5
	Temperature, deg C	20.0 (21.4) ^a
	Required SRT, days	4.3
	Ratio of influent TSS to BOD	0.96
	Ratio of influent Ammonia to BOD	0.078
	Ratio of influent TKN to BOD	0.128

Notes:

^aTemperature in parentheses is the typical extreme value for the season.

Modeling results are presented in Table 3 for the three seasonal operating conditions and the model runs are included in Appendix C.

TABLE 3
Secondary Treatment System Capacity Analysis Results

Parameter	Winter	Spring/Fall	Summer
Flow Rate, mgd	8.3	10.9	10.5
Allowable BOD Loading, lbs/day	20,759	22,264	23,810
Effluent Ammonia, mg/L	3.9	3.9	1.5
Clarifier Solids Loading, lbs/day/sq ft	21.4	21.0	17.6
Aeration Requirements, scfm	10,300	10,300	10,300
Limiting Factor	Aeration	Aeration	Aeration

The allowable BOD loading rate increase over the permitted 20,236 lbs/day for the secondary treatment system are smaller than would be expected with the addition of a third clarifier because the loading rates in each season are limited by the capacity of the aeration blowers and diffused aeration system, rather than the solids loading rate to the clarifiers. This can be explained because the aeration supply system, along with the step-feed aeration basins, were originally designed for a maximum design BOD loading rate of 19,325 lbs/day at a flow rate of 7.6 mgd during the winter and a maximum month design flow rate of 10.0 mgd and a BOD loading rate of 16,674 lbs/day in the spring, which was based on historical plant loading data from 1998 through 2001. In the last three years (2002 through 2004) the BOD loads have increased noticeably and an analysis was performed to determine the actual BOD capacity of the secondary treatment system at the request of the City. Results of this analysis showed the system BOD capacity to be somewhat higher than the original design capacity and an amendment to the WWTP site application was requested and approved by the Colorado Department of Health and Environment (CDPHE) to raise the permitted WWTP organic BOD capacity to 20,236 lbs/day.

The allowable BOD loading results shown in Table 4 are based on the maximum BOD that the system can treat under the parameters for that particular season and not on expected BOD loading rates for that season. To determine which maximum is appropriate to use for rating the organic capacity of the WWTP, it is important to explore the historical plant loading data to determine when the maximum month BOD loadings usually occur. Table 4 shows the historical peak month BOD load to the plant and the month in which it occurred from 1993 to 2004.

TABLE 4
Historical WWTP Influent BOD Loads

Year	Max Month BOD Load, lbs/day	Month in which Max BOD Occurred
1993	11,030	October
1994	10,268	January
1995	11,101	May
1996	12,838	November
1997	12,590	December
1998	13,177	May
1999	13,551	December
2000	13,308	December
2001	13,578	January
2002	15,758	July
2003	13,592	January
2004	11,030	October

Historically the maximum month BOD load has occurred in either the spring or fall, which would justify using the spring/fall maximum month capacity. However, there have been two instances when this load occurred in the winter months in the past ten years. Therefore, an analysis of historical peaking factors was performed to relate the seasonal peak month capacities to annual average capacities as shown in Table 5.

TABLE 5
Historical Peaking Factors for Seasonal BOD Loads

Parameter	Winter	Spring/Fall
Seasonal Maximum Month to Annual Average BOD Load Ratio		
1998	1.15	1.12
1999	1.03	1.14
2000	1.10	1.13
2001	1.04	1.11
2002	1.04	1.08
2003	1.05	1.11
2004	1.08	1.06
Average Peaking Factor	1.07	1.11

TABLE 5
Historical Peaking Factors for Seasonal BOD Loads

Parameter	Winter	Spring/Fall
Maximum Month BOD Capacity, lbs/day	20,759	22,264
Corresponding Annual Average BOD Capacity, lbs/day	19,400	20,057

Results of this analysis show that the winter maximum month BOD loading capacity of 20,759 lbs/day provides a lower annual average capacity and is therefore the more conservative value to use for permitting of the WWTP rather than the spring loading as originally assumed. The relatively limited increase in capacity resulting from the process modeling evaluation was discussed with the City at an interim workshop, and it was decided that the small increase in capacity did not justify the effort involved in submitting a new site application amendment to CDPHE. While the discussion in the meeting was based on the maximum month number for spring, subsequent analyses, as presented herein, have determined an even lower capacity, based on winter operation, adding validity to the decision to defer another site application amendment.

Additional Capacity Considerations

Although the secondary treatment system will gain capacity with the addition of a third secondary clarifier, other treatment process at the Loveland WWTP will impact the overall plant flow and BOD loading capacity.

WAS Thickening System

Currently WAS from the secondary treatment system is thickened in a 30 foot diameter dissolved air floatation (DAF) thickener located west of the Administration Building prior to being combined with the primary sludge for anaerobic digestion. The operators have noticed a marked decrease in performance of the DAF thickener over the past three years. An analysis of the solids treatment data provided by the plant operators was performed; the results of which are presented in Table 6.

TABLE 6
DAF Thickening System Performance

Parameter	2002	2003	2004
Average WAS flow, gpd	83,200	120,300	113,400
Average WAS solids loading, lbs dry solids (DS)/day	3874	4241	4242
Average TWAS solids recovery, lbs DS/day	2249	1344	1749
Average TWAS concentration, %	3.2	2.9	3.0
Average Solids Capture in the DAF, %	65.7	48.0	43.0

TABLE 6
DAF Thickening System Performance

Parameter	2002	2003	2004
Average Hydraulic Loading, gpd/sq ft	118	170	160
Average Solids Loading, lbs DS/day/sq ft	5.5	6.0	6.0

Although the thickened WAS concentration has remained fairly constant, the DAF solids capture rate has decreased steadily over the past three years. In addition, the current solids loading rate is at the recommended design limit (5 to 6 lbs DS/day/sq ft) for this type of thickener in a WAS application.

As WAS thickening is not a treatment process required by the State of Colorado, exceeding the design limits for the DAF thickening process will result in decreased unit performance but will not create a limiting process in terms of plant capacity.

The need for an evaluation of the Loveland WWTP's sludge thickening and dewatering systems has been identified in the City's CIP. The evaluation has been preliminarily scheduled for 2006.

Headworks Facilities

The Loveland WWTP headwork facilities include influent screening, grinding, grit removal and dewatering, influent flow measurement and sampling, and influent pumping. A screened bypass is included around the influent grinder and a bypass is also provided around the aerated grit basin. The grinding and grit removal facilities have a rated peak flow capacity of 15.4 mgd. Using the historic plant instantaneous to maximum month flow peaking factor of 1.73, this correlates to a maximum month flow of 8.9 mgd. However, these systems can be partially bypassed without affecting the overall rating maximum month flow rating of the WWTP. It is assumed that at a peak instantaneous flow of 20.7 mgd, as established in the 2002 Process Design Report for the WWTP, 5.3 mgd will be diverted through the manual bar screen in the grinder bypass channel and around aerated grit basin to join the remaining influent flow at the existing 24 inch partial flume. The existing flume is rated for a flow of 20.7 mgd.

The existing Influent Screw Pumping Station consists of a wetwell with three screw pumps, which transfer plant influent to the primary clarifier facilities. Each pump has a rated capacity of 5,350 gallons per minute (gpm). This equates to a firm pumping capacity of 15.4 million gallons per day (mgd) with two pumps on line and one pump on standby. Using a 1.73 historic peaking factor, this correlates to a maximum month flow of 8.9 mgd. The pump station includes a bypass channel from the pump station wetwell to the secondary clarifiers and, therefore, a redundant pump is not required by the CDPHE. The peak capacity of the pumping station with all three pumps on line is 23.1 mgd, which equates to maximum month flow of 13.4 mgd based on the historic peaking factor, and exceeds the peak instantaneous design flow of 20.7 mgd.

The need for an evaluation of the Loveland WWTP's headworks facilities has been identified in the City's CIP. The evaluation has been preliminarily scheduled for 2006.

Aeration Lift Pump Station

The existing Aeration Lift Pump Station consists of a wetwell with four vertical turbine pumps, which transfer primary effluent to the aeration basin splitter structure for further treatment. Each pump has a rated capacity of 3,600 gallons per minute (gpm). This equates to a firm pumping capacity of 15.6 million gallons per day (mgd) with three pumps on line and one pump on standby. Using the historic plant instantaneous to maximum month flow peaking factor of 1.73, this correlates to a 9.0 mgd maximum month flow. The pump station includes a bypass piping system that can convey flow from the pump station wetwell to the secondary clarifiers and, therefore, a redundant pump is not required by the CDPHE. The peak capacity of the pumping station with all four pumps on line is 20.7 mgd, which equates to maximum month flow of 12.0 mgd at the historic peaking factor, and equals the design peak instantaneous design flow.

The Aeration Lift Pump Station is currently being evaluated under a separate TM, and recommended improvements may be included with the design and construction of the new secondary clarifier, anaerobic digester, and trickling filter decommissioning improvements under this project.

Summary and Recommendations

The process analysis determined that the secondary treatment system could treat 10.9 mgd of wastewater flow and 20,759 pounds per day of influent BOD with the addition of the third secondary clarifier. The flow and BOD loading capacities were shown to be limited by the aeration basin and air supply systems. These results were presented at the interim project workshop to the City, and it was decided that the small increase in flow and loading capacity over the currently permitted value of 20,236 lbs/day does not justify the cost of pursuing an amendment to the site application and discharge permit through the CDPHE.

Once the evaluations of the sludge handling system, headworks, and aeration lift pump station have been completed, the impacts of these systems on the overall plant capacity will be better understood. The renewal process for the plant's discharge permit will take place in 2007, and additional capacity may be requested at that time.
